

Video Amplifier Module

Mode Code: HVA-1001

Installation

The Video Amplifier Module provides one coaxial input and one coaxial output to enhance the CATV or antenna signal strength.

1. Place the module horizontally.
2. Push the module so the hook and tab fall into the rail slots of the enclosure.
3. Slide the module LEFT and the spring fastener will automatically lock the module at the desired position.

Operation

Connect the DC power to the appropriate power source. Connect the CATV or antenna source to the "INPUT" port and the amplified signal will be at the "OUTPUT" port of the video amplifier. Connect the output port to a video device such as a TV or the input splitter for distributing throughout the home. Tune the "Gain Adjustable" knob to obtain the best possible reception. The FM trap is used to eliminate the undesired FM interference.

Note: Remember to amplify the signal before splitting to other video devices.
